1

What Maren is

A consumer borrowing and payments layer for MUSD, built for Mezo and deployed nowhere else. Users deposit Bitcoin, borrow MUSD against it from 0.001 BTC, and spend it against `@handles`. Talise stays on Sui; Maren is a separate product under a separate name, which is our answer to the separate-deployment and exclusivity questions.

2

What the chain actually shows

MEASURED 19 AUGUST 2026, MEZO MAINNET

MUSD total supply	~31 million
Created by user borrowing	~4.6%
Sitting in the Stability Pool (farm)	~46%
Held by the top 20 addresses	~99.5%
Troves open	fewer than thirty

MUSD today is a DeFi-internal asset: minted mostly by the protocol, parked in yield strategies and AMM pools, and barely borrowed by users. There is no consumer economy for it. Two frictions explain that. The protocol imposes a **2,000 MUSD minimum loan** (about $3,000 of BTC to open responsibly), so a small holder cannot borrow at all; and once you hold MUSD there is nowhere consumer-grade to spend it. Maren's pooled vault removes the minimum entirely, borrowing from 0.001 BTC with **no minimum loan size**, and its payments layer gives MUSD somewhere to go. Whether that creates real demand is a bet, and the evidence for it is off-chain in Mezo's community rather than on-chain in the trove count. Every Maren user is a net-new MUSD borrower.

3

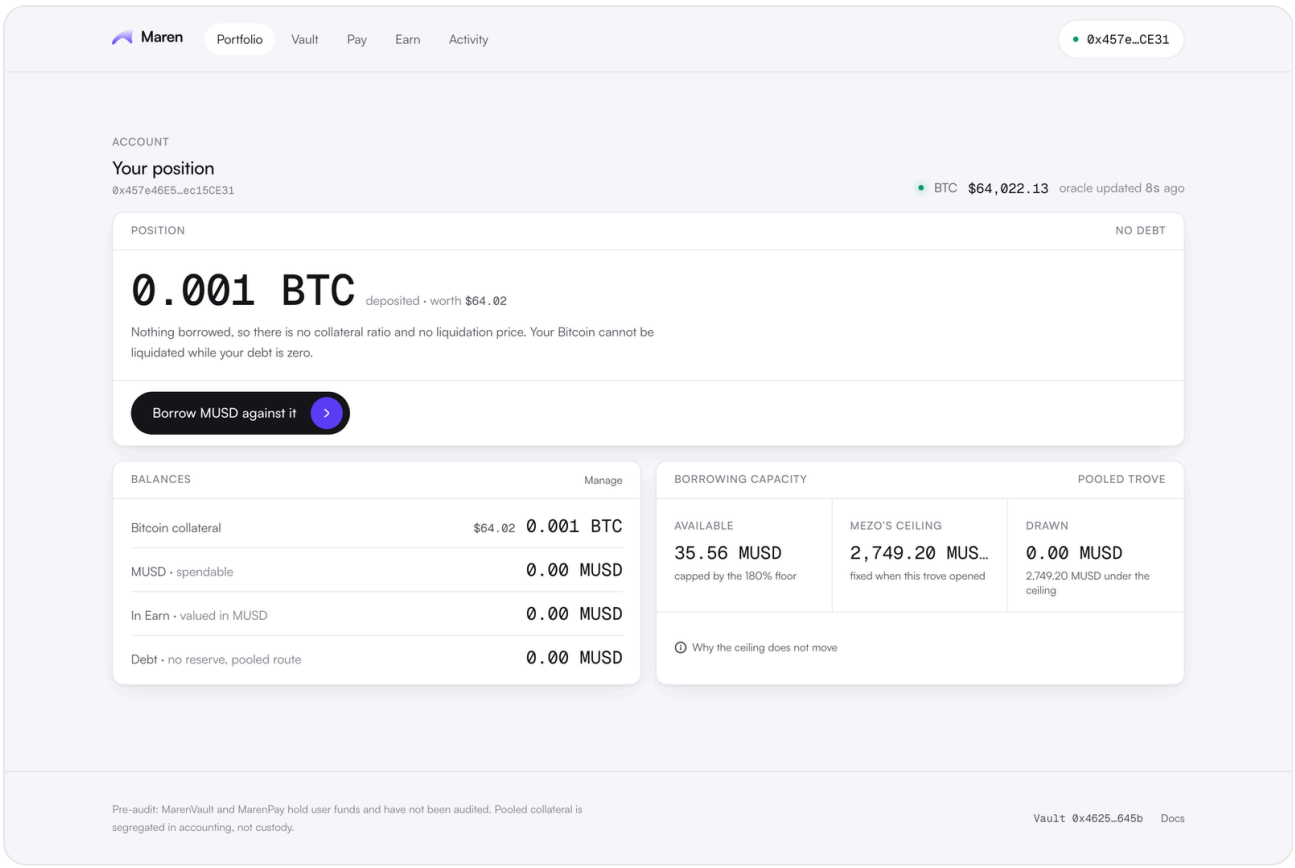

Deployed and checkable today, matsnet (31611)

Five contracts, source-verified on Blockscout, led by MarenVault at `0x46252B00AB59384518d9dB6D1f210ffF1221645b`. The pooled trove is active inside MUSD's own TroveManager at **223% ICR** with borrowing enabled, and the `@sele` handle is registered through commit-reveal. 302 contract tests plus 11 forked against real matsnet MUSD; 286 on the relayer. The web app reads and writes these contracts live, including a real user borrow; the iOS app runs the same screens on a mock layer with identical signatures, pending live wiring.

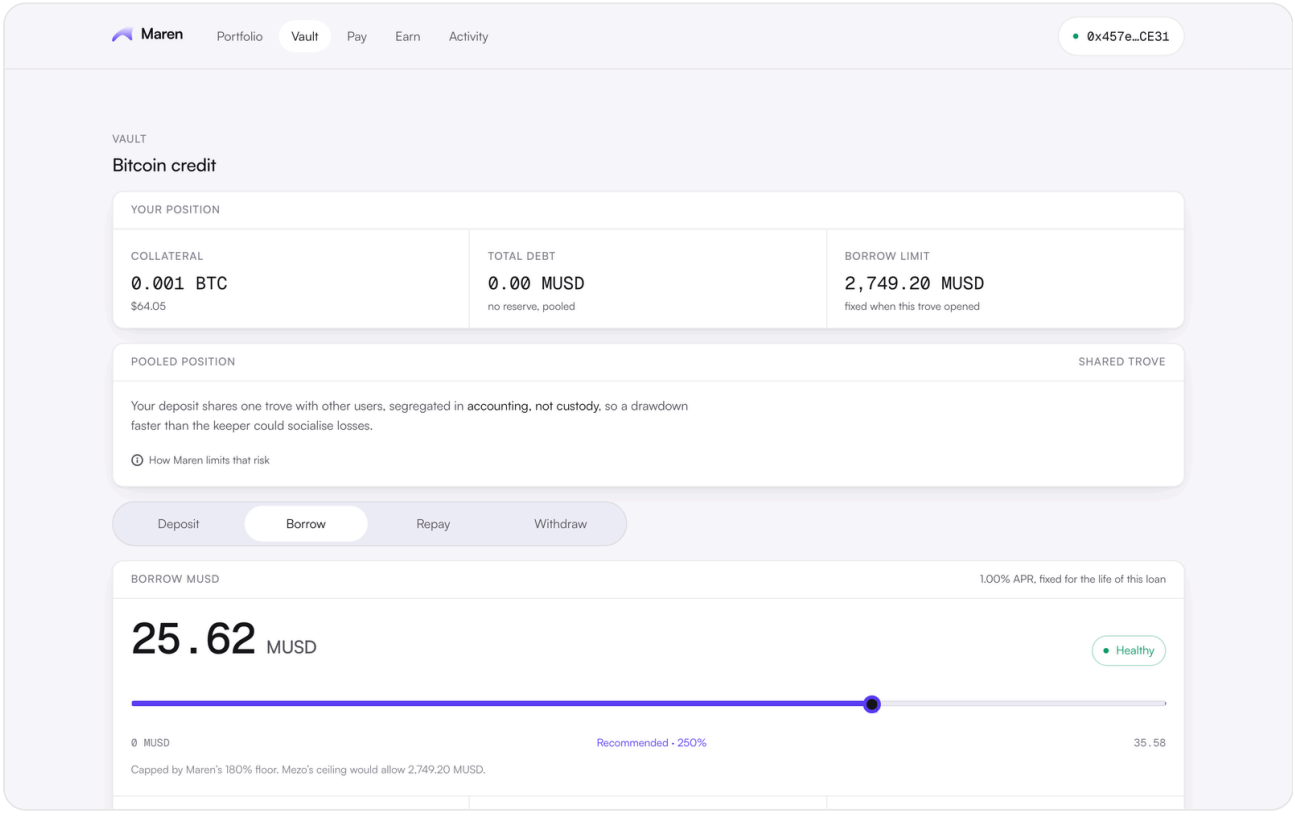

4

The product, as it runs today

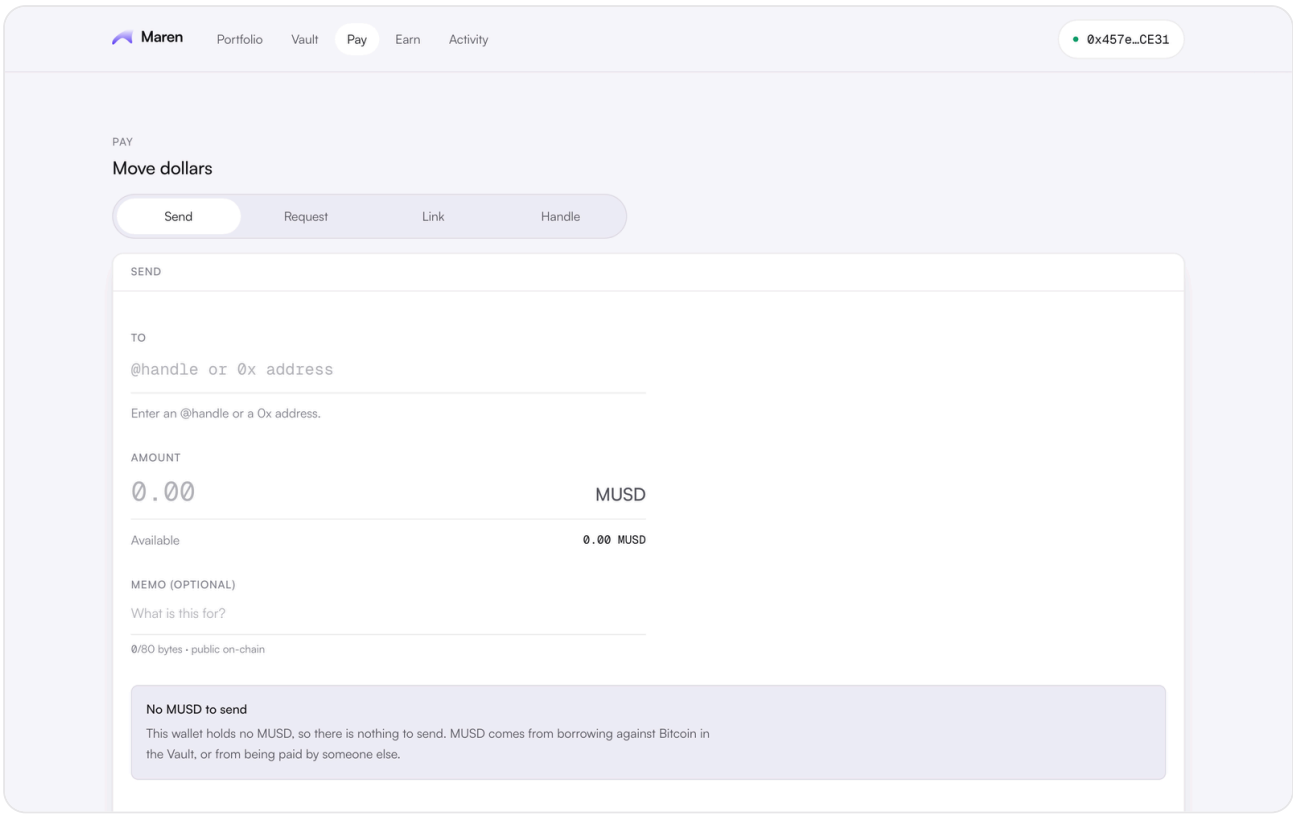

Screenshots below are unretouched captures of the web app in a read-only session against live matsnet. Every figure in them is a contract read; the borrow offer shown is the preflighted maximum the deployed vault would actually accept at that moment.

Portfolio. A funded account with no debt: 0.001 BTC deposited, and the interface states plainly that nothing can be liquidated while debt is zero.

Vault. Borrowing live against the pooled trove: the slider is bounded by the same computation the contract enforces, with the recommended 250% marked.

Pay. MUSD moves against @handles or raw addresses, with an on-chain memo. An empty wallet is told where MUSD comes from rather than just refused.

5

Not done, stated plainly

No mainnet deployment: gated on audit, deliberately. No audit yet: it is the real constraint, and it costs more than this grant. The relayer is built and tested but hosted nowhere, so today users submit their own transactions and the app says so.

6

Milestones, and two asks

40% on a verified mainnet deployment, per the terms; the remainder against chain-readable outcomes: **250 funded positions, $250,000 borrowed**, roughly ten times Mezo's borrower count. The asks worth more than the money: an introduction to whoever audited MUSD, and fifty people from the Discord on matsnet in September. Real users find what tests do not.

Every number on this page was read live from Mezo RPCs on 19 August 2026. The counts drift daily and are quoted to the precision at which they hold. Where this page and a longer document disagree, the chain wins, and the verification appendix in MRN-002 shows how to ask it.
